

## Introduction

Introduced in [Tiki10](#), the workspace UI provides site administrators with a streamlined way to create simple workspaces, which allow a group of collaborators to work in their own "protected" area.

Using the workspace UI site admins can:

- Define templates for creating workspaces of different types
- Instantiate workspaces using a given template

You can still create workspaces manually

Note that the Workspace UI does not give you the full flexibility of Tiki workspaces. If your needs are a bit "out of the ordinary", you may need to set up your workspaces using a [more manual approach](#), or playing with the [advanced interface and yaml code](#) (see [below](#)).

### 1.2. Tutorial: Creating a workspace

Let's say you are managing a project called OurFabulousProject, and you want to create a Tiki workspace where all the people on that project can share information.

In this tutorial, we will show you how to do this.

#### 1.2.1. Activate the Workspace UI

If the Workspace UI feature is not already activated, you need to do so.

\* Admin home

\* Check the **Advanced** and **Experimental** boxes, then **Set as my defaults** (Workspace UI involves some advanced and experimental components)

- **Admin > Workspaces**

# Workspaces ?

Configure workspace feature

Apply

Workspaces

Areas

No Tabs

## Activate the feature

Workspace UI

You need to set **Namespace**

You need to set **Perspectives**

You need to set **Category**

## Dependencies

Namespace

Namespace separator

Force all non-namespace page links to the same namespace

Perspectives

Category

Wiki

Activating WorkspaceUI feature | Click to expand

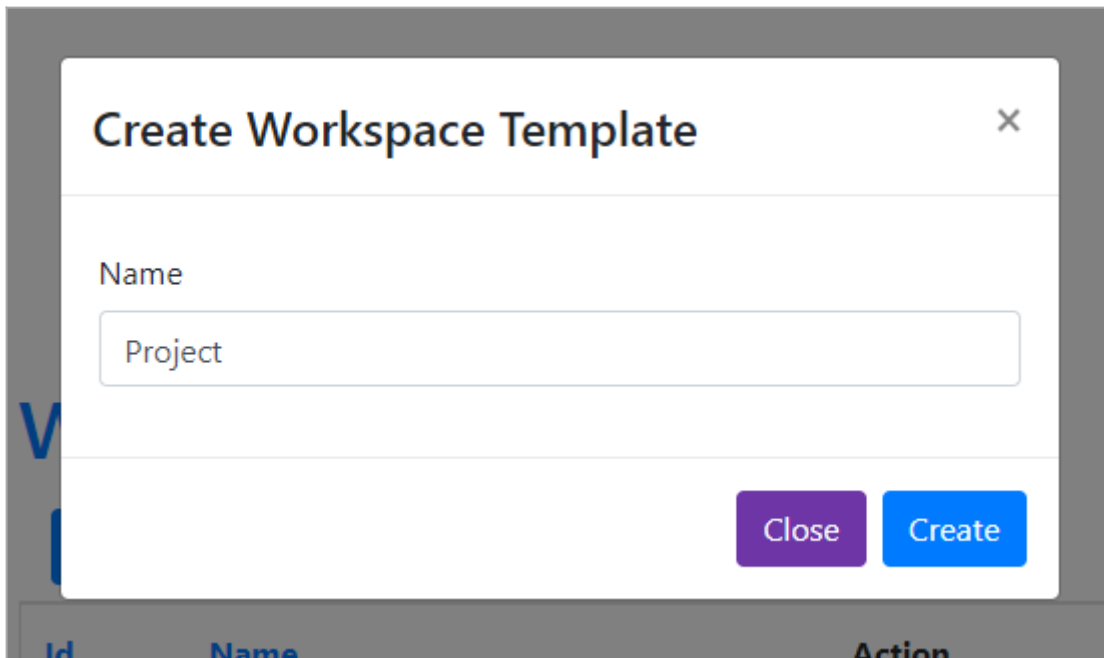

\* Check the following checkboxes: **Workspaces UI**, **Namespace**, **Perspectives**, **Category** and **Wiki**.

- Hit the "Apply" button

### 1.2.2. Create a template for the workspace

In order to create a workspace template, you need to follow these steps:

- **Admin > Workspaces**
- Hit the **Workspace templates** button
- **Create Workspace template**, a new popup window will appear
- In **Name**, enter the template's name (let's call it **Project**)

Id Name Action

Creating Workspace template | Click to expand

Now that you have your brand new template, you need to set some permissions to decide what people who belong to the workspace can do there.

- Click on the **Permissions** button besides the **Edit** button, on the **Project** workspace template line.

Check the permissions you want to apply to the workspace. The only permission is to allow to users, from different categories, being able to create workspaces for this given template. In our case, we won't set that. Let's keep the admin being the only one to create workspace for this template.

### 1.2.3. Create a new workspace using the template

Now that we have a template for creating workspaces for projects, let's use it to create one.

- **Admin > Workspaces**
- Hit the **Workspace templates** button
- Hit the **Create workspace** button
- For **Template**, pick the **Project** template we just created.
- For **Name**, enter the name of the project **OurFabulousProject**,.
- **OK**

Creating a workspace | Click to expand

#### 1.2.4. Go to the workspace's home page

That's it. You now have a workspace called **OurFabulousProject**. You can go to the workspace's home page: `tiki-index.php?page=Project:_:OurFabulousProject`. This workspace's home page is empty (no content). As it's a wiki-like page, let's add some description to be more explanatory for the members we will add further in this tutorial.

Workspace's home page | Click to expand

#### 1.2.5. Assign users to the workspace

The final step is to make sure that members of the project team have access to the workspace.

All you have to do is to assign those users to the group. For example, if you want user **kishiko** to have access to the workspace, you do:

- **Admin > Users**
- Hit the **Assign user to groups** button

# Admin Users

 Admin Groups

 Permissions

Add a New User

Users

Edit user *kishiko*

Import

Temporary Users

No Tabs

## Edit user kishiko

 Assign user to Groups

User

kishiko

New password

Password

Confirm new  
password

Password

User interface | Click to expand

- Click the **Assign** button on the **Project:\_:OurFabulousProject** line. You will be asked to confirm this action.

## Assign User kishiko to Groups

Find...

Displayed rows

25

Find

Name	Description	Expiration
Admins	Administrator and accounts managers.	 Assign
<i>Admins</i>	<i>Administrator and accounts managers.</i>	 Assign
Project:_:OurFabulousProject	Project:_:OurFabulousProject	 Assign
Registered	Users logged into the system	
<i>Registered</i>	<i>Users logged into the system</i>	 Assign

Save

Assigning a user to the workspace | Click to expand

As a result, **kishiko** is our first member of the workspace. He is able now to see the workspace's home page in the list of wiki pages.

Do so for all the users you want to make as members.

### 1.2.6. Final tip

You can, besides setting permissions to a workspace template, setting also permissions to the workspace itself. The process is similar for all the wiki-like pages.

## 1.3. Internals of a workspace

### Basic building blocks

As you may have surmised from the above tutorial, a workspace is made up of a bunch of lower level building blocks which are packaged together to provide a "workspace user experience".

The building blocks are:

- A category in which all content of the workspace will be put
- A group to which all collaborators of the workspace will belong
- A perspective to improve the experience when working inside a workspace

Note that in the above tutorial, we only used a wiki in the workspace. But a workspace template can include a lot more features, such as: blogs or forums. More features are being added in the interface. However, if something not supported is required, an advanced mode is available, but requires writing a [Data Channel](#) through the special interface.

Currently supported through the interface:

- **Groups:** Allows to create additional groups within the workspace, modify the default group and manage the default permissions.
  - Allows to specify which groups are automatically joined by the workspace creator
  - Allows to specify which group is the managing group. Members of this group can manage the members of the other groups
  - Default permissions applied on the category for the groups within the workspace can be selected
- **Wiki pages:** Allows to define pages created within the workspace and define their initial content.
  - Original content can be defined directly from the interface or be taken from an existing page as a template
  - All pages are created within the default namespace

### Workspace organization

All workspaces are created under the same root category (called Workspaces), which is created the first time a workspace is created. As a next level, the template name is used as a category, and finally the selected workspace name is used. If the workspace name contains namespace separators, a hierarchy of categories will be created.

Assuming the template is called *Project*, and the selected workspace name is *Infrastructure::Improvements 2012*, the category tree would be the following:

- Workspaces
  - Project
    - Infrastructure
      - Improvements 2012

### 1.4. Edit a Workspace Template in advanced mode (yaml)

Once you have created a workspace template, you have the option to edit it through either the **simple**

**interface**, of the **advanced interface**. To edit a workspace template in advanced mode (yaml), you need to be on the template page and hitting the **Advanced mode** text link in the alert info:

Advanced mode for a workspace template | Click to expand

While using the simple interface (image above), you have an easy way to add new default groups or wiki pages in the workspace template, so that they are created as objects (groups and pages) when a new workspace of this type is created.

Then you have the workspace template in advanced mode. In which you can edit in yaml code:

# Edit template Project

Workspace Templates

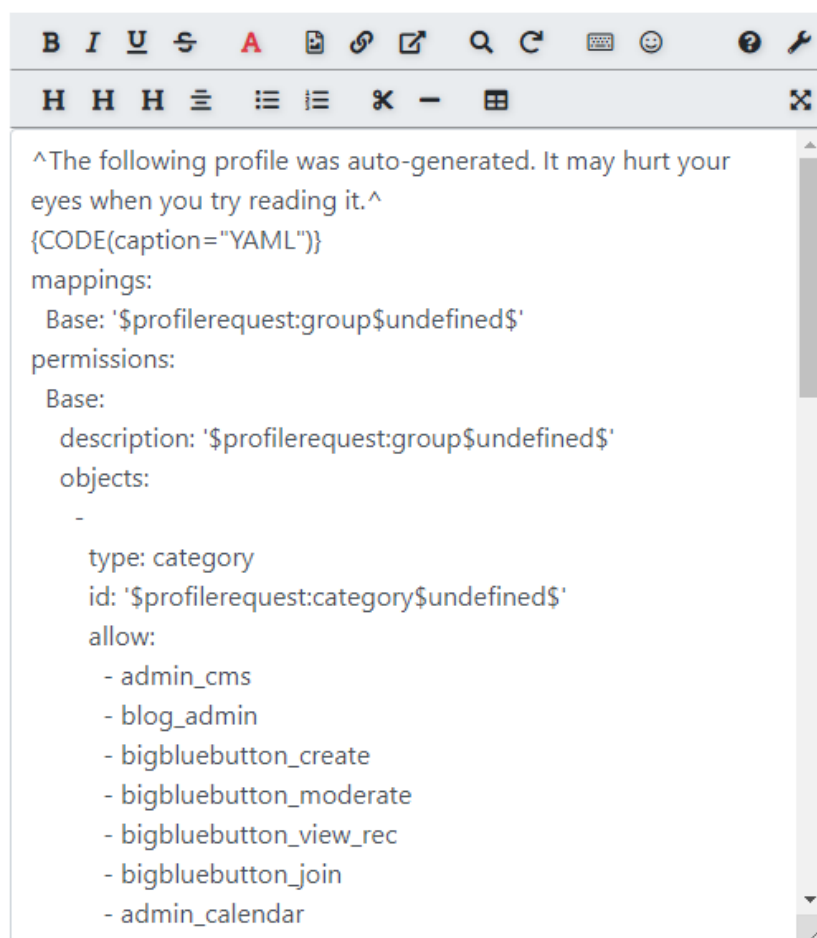

## ⚠ No turning back

Once you switch your template to advanced mode, there is no turning back. The simple interface will no longer be available.

**Return to simple interface**

Name

Project

```
^The following profile was auto-generated. It may hurt your
eyes when you try reading it.^
{CODE(caption="YAML")}
mappings:
  Base: '$profilerequest:group$undefined$'
permissions:
  Base:
    description: '$profilerequest:group$undefined$'
    objects:
      -
        type: category
        id: '$profilerequest:category$undefined$'
        allow:
          - admin_cms
          - blog_admin
          - bigbluebutton_create
          - bigbluebutton_moderate
          - bigbluebutton_view_rec
          - bigbluebutton_join
          - admin_calendar
```

Save

Viewing the advanced mode for a workspace template | Click to expand

When you switch the interface to Advanced mode (image above), you have full control on the contents of the workspace template, and you are eventually able to define new objects (of other types: blogs, file galleries, forums, ... as far as a [profile handler](#) is created for them) to be linked with that workspace template.

For more information on this advanced feature, ask in the [Developers list](#)
