API Tracker

Tiki supports URL arguments and they can be used to interact with the Trackers and the plugins displaying or creating items. For example you can define a default value for a field in a customSearch or force the insertion of a value when creating an item.

Examples

Allow creation, edition and deletion of tracker items in a modal pop-up

This is the html syntax for use in a smarty template file.

Creation of an item in tracker 1

 $\label{lem:condition} $$ \access="click-modal tips" title=":Create new item" data-role="button" data-inline="true" href="tiki-tracker-insert_item?trackerId=1">Create new item$

Edition of item 3 in tracker 1

Edit item 3

Deletion of item 3 in tracker 1

Remove item 3

Create/Update some fields of an item using editable

If you want to update two fields which permanentNames are name and surname and leave the other fields unchanged:

Edition of two fields of item 3 in tracker 1

tiki-tracker-update item?trackerId=1&itemId=3&editable[]=name&editable[]=surname

(same principle for item creation)

Hide some fields of an item on the creation/edition using noteditable

If you want to hide two fields which permanentNames are name and surname and edit the other fields:

Hiding of two fields of item 3 in tracker 1

tiki-tracker-update_item?trackerId=1&itemId=3¬editable[]=name¬editable[]=surname

(same principle for item creation)

Pre-fill field values using fields

Note: once you use *fields*, only the fields which you specifically mention will be available for edition.

Edition of three fields of item 3 in tracker 1 with a prefilled value

tiki-tracker-update item?trackerId=1&itemId=3&fields~name&fields~surname&fields~education=None

Creation of item 3 in tracker 1 with a prefilled value and two extra fields

tiki-tracker-insert item?trackerId=1&itemId=3&fields~name&fields~surname&fields~education=None

This will prefill the "education" field and it will display fields *name* and *surname* as empty fields. It is probably perfect for creating a new item but not what you would expect for editing an existing item (loss of previous values).

A better solution which does not lose previously entered content:

Edition of three fields of item 3 in tracker 1 with one prefilled value

tiki-tracker-

update item?trackerId=1&itemId=3&editable[]=name&editable[]=surname&editable[]=school&fields~education=None

To set a link that will create a new item and force-insert and hide a value for a field

Here we use it to create an item with a specific category Id. (replace "childrenIdNumber" with your category field permaname)

tiki-tracker-insert item?trackerId=2&next=tiki-tracker-insert item%3FtrackerId%3D3&forced~childrenIdNumber=17

All fields can be edited except the one which is forced which will not be shown.

This can be used with a variable like a field from a plugin list. Here we prefill the (user)name and hide it. The smarty replace modifier is required to remove extra space(s) added to the value(s)

tiki-tracker-insert_item?trackerId=11&forced~paymentsFamilyName={\$row.name|replace:'':"}

To set a link that will open the update modal for an existing item and insert a value for a field

Here we use it to create an item with a specific category Id. (replace "permaname" with your category field permaname)

 $tiki-tracker-update_item?trackerId=2\&itemId=178\&fields \sim childrenIdNumber=17$

Status control with tiki-tracker-insert item and tiki-tracker-update item

code	status of saved item	is status selector displayed in pop-up window?
status=open	open	yes
status=pending	pending	yes
status=closed	closed	yes

status=0	default value in tracker properties	No
nothing about status	default value in tracker properties	only if "show status" is set in tracker properties

Example

 $tiki-tracker-insert_item?trackerId=57\&editable[]=inscrContenuCmdCommande\&status=closed$

Updating a tracker field using POST
