

this is a stub

You may need these settings for Tiki to work under Cloudflare setups:

```
Tiki Settings: http_port: NULL https_port: NULL session_protected: n login_http_basic: ssl feature_switch_ssl_mode: n
https_login:force_nocheck .htaccess settings RewriteCond %{HTTP:X-Forwarded-Proto} =http #redirect all http traffic
RewriteRule ^ https://%{HTTP_HOST}%{REQUEST_URI} [L,R=301] RewriteCond %{HTTP_HOST} ^www\.(.*)$ [NC] #
redirect all www traffic RewriteRule ^(.*)$ https://%1/$1 [R=301,L]
```

The setting `https_login` (Use HTTPS login) needs to be set to encourage (Encourage secure (https) login).

Any other setting except for `disable`, would make your site unusable, as of [Tiki 15](#) LTS and maybe newer versions.
