

Google Web Fonts

It's quite easy to use [Google Fonts](#) in Tiki!

See also: [PluginFont](#)

How to configure

The screenshot shows the 'General Layout' tab selected in the top navigation bar. Below it, a section titled 'Theme Generator (Experimental)' contains a checkbox labeled 'Theme Generator' and two status icons: a blue info icon and a yellow warning icon. A 'Custom Codes' section follows, containing a 'Custom CSS:' input field with the code: `html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }`. Below this is a 'Change Highlighter' button. Further down, there's an 'Experimental: CSS assistant (work in progress - click the x to remove)' message and a 'Custom HTML <head> Content' input field with the code: `<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>`.

To affect most of the text

```
html > body, *:first-child + html body
```
