

Plugin Signature

Use this [wiki plugin](#) to interactively sign a page with your hand written signature.

Not to be confused with [PluginSign](#)

Parameters

Allows to draw signatures

[Go to the source code](#)
Preferences required: `wikiplugin_signature`

Parameters	Accepted Values	Description	Default	Since
<code>align</code>	<code>text</code>	Signature image align in document (default is left)		
<code>editable_by_groups</code>	<code>text</code>	Put some groups that are allowed to edit this plugin		
<code>editable_by_user</code>	<code>text</code>	Put some usernames that are allowed to edit this plugin		
<code>height</code>	<code>digits</code>	Signature image height (default is 200px)		
<code>name</code>	<code>text</code>	Name of component.		
<code>width</code>	<code>digits</code>	Signature image width (default is 400px)		

Examples

This code:

```
{signature}
```

Would produce:

Screen Captured Demonstration

Miscellaneous

It uses https://github.com/szimek/signature_pad

We have pushed a new `wikiplugin_signature`, which allows to draw a signature and save it as an image. How to use: `{CODE()}{signature} {CODE}` Additional params: * name - Like the "person" who should sign (example: customer). The name is displayed in the signature button. * width - The signature image width (default is 400px). * height - The signature image height (default is 200px) * align - Where to position the signature (default is left). After save, the image is stored within the plugin content as image/png base64. The plugin is also ready for PDF export since it uses images after signature is saved. Caveats: Who signs needs permission to edit the tiki-page. Code changes delivered to master: https://gitlab.com/tikiwiki/tiki/-/merge_requests/608
