Plugin Help

This is a stub

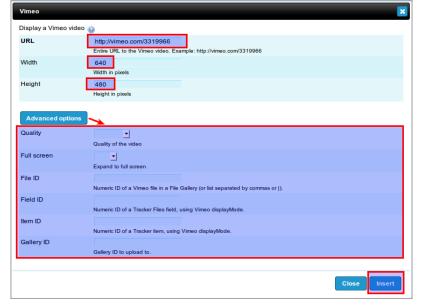

Introduced in Tiki3, this permits to fill out a form to build or edit a plugin. Thus, no need to remember or look up the syntax.

When you are editing a wiki page or any other textarea in the website, you can click on the icon to open the help copup box (1). Then you can click at the tab to show the plugin help (2), and filter the list of plugins for some keyword ("video" in the example) (3).

Click to expand

Once you click in the icon of the specific plugin (4, in the image above), a new popup box replaces the previous one, showing the specific parameters for that plugin, and you can optionally also display the params hidden by default under the "Advanced options" section through clicking at the corresponding button with that name:

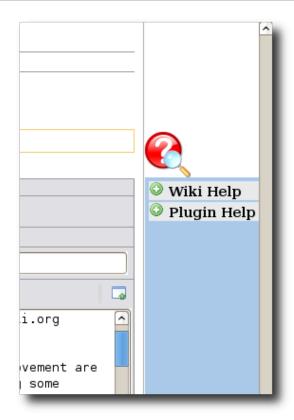

Click to expand

And when you click at insert, the code is inserted in the wiki page:

Wiki Help revamped

The Wiki Help has been revamped so that it is offered on the side as a red balloon with a lens on top. When you click on it, it allows you to select the Wiki help or Plugin help, once you click on any of the green + signs on their left.

For instance, if you click on the © icon next to Plugin Help, you'll be shown the new edit help, where you can scroll on the side independently of the scroll of the wiki page, and click on the "**Insert**" link next to any plugin title.
