

Plugin A Name

This [wiki plugin](#), available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the [PluginAlink](#), which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the [PluginAlink](#) to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

PARAMETERS

Create an anchor that can be linked to

Introduced in Tiki 1.

[Go to the source code](#)

Preferences required: `wikiplugin_aname`

Parameters

(body of plugin) - The name of the anchor.

no parameters

USAGE

To take use this plugin in a wiki page, use the syntax:

{ANAME()}anchorname{ANAME}

In the generated XHTML for your webpage, Tiki will create the following anchor:

```
<a id='anchorname'></a>
```

Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores (_). For example, {ANAME()}my custom anchor{ANAME} will render as: ``.
- Starting with Tiki release 2, Tiki generates the anchor using the `id` attribute. In prior releases, Tiki used the HTML `name` attribute (``).

EXAMPLE

ANAME PLUGIN USAGE

{ANAME() }

`anchorname` *<--put the name of the anchor here. Use this same name for the aname= parameter in the Plugin Alink (see just below).*

{ANAME}

Here is a second [link](#) to the same anchor at the bottom of the page. Again, I used the `ALINK` plugin.

The anchor is here. <-- I put the `<div style="border: 1px solid black; padding: 2px 5px; display: inline-block;">ANAME` plugin at the beginning of this line. Now you can click **HERE** to jump to the anchor I put at the top of the page (you can't see where that one is unless you look into the page editor `←`)
