

# Plugin AÂ Name

This wiki plugin, available since Tiki1, creates an anchor in a wiki page that can be linked to. Use in conjunction with the PluginAlink, which creates the link to the anchor.

Starting with Tiki release 2.0, Tiki will automatically create anchor points for all headings in a wiki page. You can use the PluginAlink to link to any heading on a wiki page *without* having to use a corresponding ANAME plugin.

## Parameters

Create an anchor that can be linked to

*Introduced in Tiki 1.*

[Go to the source code](#)

*Preferences required:* wikiplugin\_aname

---

### Parameters

*(body of plugin)* - The name of the anchor.

*no parameters*

---

# Usage

To take use this plugin in a wiki page, use the syntax:

```
{ANAME()}anchorname{ANAME}
```

In the generated XHTML for your webpage, Tiki will create the following anchor:

## Notes:

- If you include spaces in the anchor name, Tiki will convert the spaces to underscores ( ).

For example, `{ANAME()}my custom anchor{ANAME}` will render as: .

- Starting with Tiki release 2, Tiki generates the anchor using the `id` attribute. In prior releases, Tiki used the HTML `name` attribute `()`.

# Example

# Aname Plugin Usage

{ANAME() }

anchername <--put the name of the anchor here. Use this same name for the aname= parameter in the Plugin Alink (see just below).

{ANAME}

ANAME example: {ANAME()}anchername{ANAME}

# Alink Plugin Usage

```
{ALINK(  
aname=anchorname <-- put here the name of the anchor you created using the Plugin Aname!  
)}
```

```
link text <-- put here the text to appear as the link.
```

```
{ALINK}
```

```
ALINK example: {ALINK(aname=anchorname)}link text{ALINK}
```

or rather, I only work so

```
ALINK example: -+{ALINK( aname="anchorname" pagename="wiki pagename")}link text{ALINK}+
```

# Demonstration

To jump down to the anchor at the bottom of the page click **HERE**. <-- Here is where I put the `ALINK` plugin in this page.
