ⓘ Deprecated

Check the [Plugin MetaTag](#) and use it instead.

# Plugin Meta

Use this [wiki plugin](#) to be able to insert one or more custom meta tags in the HTML `head` of the page where the plugin is present.  
Useful when you want to provide custom meta tags per page, e.g. for sharing with specific image on [Social Networks](#).  
As the body (data) of the plugin is taken as raw html it always requires [plugin approval](#) by trusted site Admin/Editor on each edit.

- [Parameters](#)

## PARAMETERS

Tiki Doc From Code error: metaplugin not found

## EXAMPLES

Short syntax example:

```
{meta content="http://your.site.tld/foo.jpg" name="twitter:image"}
```

Block syntax example:

```
{META()} <meta content="http://your.site.tld/foo.jpg" name="twitter:image"> <meta content="http://your.site.tld/foo.jpg"
property="og:image"> {META}
```

## LIMITATIONS

1. It only adds the tag(s) to the `head`, it does not replace them, so if the same meta name tag is added, it will be twice there and first one takes the precedence
2. The plugin content must be approved, so it cannot be used for dynamic variables (unless all variants are approved)
