

Plugin Profile

Introduced in Tiki3

Use this [wiki plugin](#) to add an install button for installing a profile. It allows a profile to be installed from anywhere, instead of only via the profile admin interface (`tiki-admin.php?page=profiles`).

Profiles are used to automate configuration of a site, turning on feature sets and permissions schemes and adding content. This way a site can be configured with a single click rather than 100s of clicks. See profiles.tiki.org for more information.

PARAMETERS

Add a button for applying a profile.

*Introduced in Tiki 3. Required parameters are in **bold**.*

[Go to the source code](#)

Preferences required: `wikiplugin_profile`

Parameters	Accepted Values
------------	-----------------

name	text
-------------	------

domain	url
---------------	-----

Description

Name of the profile to be applied.

Profile repository domain. Default value is

`profiles.tiki.org`

Default	Since
profiles.tiki.org	3.0

LIMITATIONS

- It only installs the named profile, not its dependencies (if any)
- After applying the profile, it returns on the same page from which it was called (it means it ignores going to the Instructions page (if any))
- It doesn't have the edit plugin helper icon displayed (even if "Disable edit plugin icon (make plugin inline)" is not checked on `tiki-admin.php?page=textarea&cookietab=2`)

EXAMPLES

This code:

```
{profile name="Personal_Blog_and_Profile"}
```

Would produce (screenshot):

A screenshot of a rectangular button with a white background and a blue border. The word "Install" is written in blue text in the center of the button.
