

Plugin Regex

Use this [wiki plugin](#) to use a "regular expression" style search expression from another wiki page to search for and replace text in the body of the plugin (between the **REGEX** tags).

PARAMETERS

Perform a regular expression search and replace
*Introduced in Tiki 1. Required parameters are in **bold**.*

[Go to the source code](#)

Preferences required: wikipugin_regex

Parameters	Accepted Values
------------	-----------------

(body of plugin)

pageName

Description

Each line of content is evaluated separately

Name of page containing search and replace expressions separated by two colons. Example of syntax on that

page: `/search pattern/::replacement text`

Default	Since
pageName	1

To use this plugin:

1. Place the search pattern (enclosed with forward slashes) and replacement text on a separate wiki page, separated by two colons (`::`). For example:
`/search pattern/::replacement text`
2. Then enter that page name as the `pageName` parameter value of the plugin.
3. The text in the body of the plugin (between the `REGEX` tags) will be searched and each match of the search pattern will be replaced by the replacement text.

This plugin mimics the [preg_replace](http://www.php.net/manual/en/reference.pcre.pattern.syntax.php) PHP function. For advanced search patterns, see <http://www.php.net/manual/en/reference.pcre.pattern.syntax.php> in the online PHP manual or simply search the internet for "regular expression syntax".

EXAMPLE

This code:

```
{REGEX(pageName="PluginRegex Example")}I had a horrible day.{REGEX}
```

Plus this syntax on a separate wiki page called [PluginRegex Example](#):

```
/horrible/::wonderful
```

Would produce:

I had a wonderful day.
