

# Sync Dev-Prod Servers

Since Tiki19 we have a feature to compare 2 different Tiki setup.

Go to "tiki-admin\_sync.php" and use this tool if you have at least two different Tiki instances serving as development, staging or production instances.

You can compare differences between Tiki configuration, wiki pages and their contents as well as tracker and field configurations. Especially useful when changes from a development server needs to be applied to production one. This tool will only show differences between instances, you will still have to manually apply the changes to the production one.

# Usage

To compare 2 tiki you need to log as admin into your Tiki.  
To go to "tiki-admin\_sync.php" and to fill:

- The url of the second Tiki
- The Admin login
- The Admin password

The screenshot shows the Tiki Wiki CMS Groupware interface. In the top left corner is the Tiki logo with the text "wiki cms groupware". In the top right corner is a "Log out" link with a dropdown arrow. On the left side, there is a "System Menu" sidebar with links for Home, Search, Wiki (with a dropdown arrow), File Galleries (with a dropdown arrow), Trackers (with a dropdown arrow), and Settings (with a dropdown arrow). The main content area is titled "Synchronize Dev/Prod Servers" in blue text, followed by a small icon and a link. Below the title, there are three input fields: "Remote Server Address" containing "http://localhost/tiki19\_version\_2", "Login" containing "Admin", and "Password" containing six asterisks. A blue "Show diff" button is positioned below the password field.
