ser, Group, IP selectors are Tracker Field Types used in the trackers feature to attribute items to specific users. Adding a name to tracker item is necessary but not sufficient to create special viewing and editing privileges - often used with User Tracker, registration tracker or Group tracker

The page Adding fields to a Tracker explains how the fields, (columns or questions) of a tracker are set up.

USER SELECTOR

User Selector

Auto-Assign

associates the item field to a user by login name.

default an open selection from the whole list of usernames. **N.B.** do not use this feature if the user list is private.

> assign item to its creator - This option is necessary if you want to limit the modification of the item to its creator and administrators.

Item Owner

Email Notification

- 2 assign item to "last modified by" the is filled up by the item creator or editor user name.
- defaultIs this field an ItemOwner field that determinespermissions of the item? (since Tiki17)
- 0 No tiki >= 17
- 1 Yes tiki >= 17
- default a notification email is sent to the specified user each time the tracker item is modified(or created)

tiki > = 1.10

For instance a field with options "1" will assign the user who created the tracker item to the field

field with option "0,1" will let the user to choose a user and to send a mail each time the item is modified (can be convenient for a sign to field")

The notification email contains the list of fields with the old and new values for each field that changed.

Display limitation: _____tiki >= 1.10

If you want only display some users for a user selector field with no automatic feeding, you can checked the list you want while

defining the field.

Note on how to get auto-assignment work in the TRACKER Plugin: In case it did not work as you expected, you could (1) try to set view="user" in the plugin

(2) hide the field for everyone except for admin, and add it to the plugin's fields parameter. This works for both the group and the user selector fields. One current drawback (in Tiki5.0B1): the field labels are shown in both cases. As long as it is not fixed, one could use pretty trackers to circumvent this problem. Find more details in a related bug tracker item.

SELECT MULTIPLE USERS FILTERABLE BY GROUPS

Since Tiki 17, the user selector tracker field alows selecting multiple users, and that selection can be on a full list of site users, of filterable by groups of users:

Assigned to				
Filter by group: Ceo Clients Contractors Editors Gc	×	Select user(s): client2 contractorA contractorB gc staff1		•
			Close	Save

This is also useful for notifications to user creators/owners of a tracker item, to handle permissions per item when no full permissions are granted in the whole tracker level but only to the items that the user is set as creator/owner of the item.
