Is anyone else having trouble with the wiki3d browser?

I had it running a while ago (last year) and recently tried to get it back again, but it no longer seems to work on my remote servers.

I have tried it with 1.9.7 and the latest BRANCH-1-9 version (1.9.8) on three servers and only my local one (running on Mac OS X 10.4) works properly.

I uploaded the 1.10 HEAD version and that does work ok, both remote and locally.

The exception in the Java console i get is:

```
Thu Jul 12 17:02:44 BST 2007 JEP creating applet br.arca.morcego.Morcego
    (http://epnet.org/tiki198/lib/wiki3d/)
Morcego rulez!
java.lang.NullPointerException
    at br.arca.morcego.transport.XmlrpcTransport.fillGraph(XmlrpcTransport.java:91)
    at br.arca.morcego.transport.XmlrpcTransport.retrieveData(XmlrpcTransport.java:85)
    at br.arca.morcego.run.Feeder.run(Feeder.java:138)
    at java.lang.Thread.run(Thread.java:613)
```

My initial theory was that my hosting people had somehow blocked the XMLRPC thing, but as 1.10 works ok i don't think that can be it.

Any ideas?

TIA
jonny

Jonny, write this type of message to <http://tikiwiki.org/forums> (Features/Usability, I suggest). Here only to discuss issues with documentation.

Cheers,

Xavi

P.S: No idea myself... (haven't tried it for months...)

P.S.2. Consider adding a Bug report to <http://dev.tikiwiki.org/Tracker5> if after some time you don't get successful answer

from tw.o forums...

Thanks Xavi

I just clicked the "discuss" button on the doc page, so thought it would take me to somewhere to discuss the feature (i know now) - i'll try the other forum as i have a feeling it's to do with my ISP's set up, and not really a bug as such.

jonny
